Adrian Ng MSc.

Seeking Junior-Level Data Engineering Opportunities

Email: contact@adrian.ng
Website: adrian.ng

Summary

I am a Computer Science graduate passionate about Data Engineering. I seek opportunities that further my growing experience in *Java* – which I have used in numerous academic projects ranging from the implementation of financial models to large-scale data processing with *Apache Hadoop MapReduce*.

Prior to postgraduate study, my expertise was in *SQL development* focusing on the implementation of CRM segmentation processes for a number of clients including: *Virgin Media*, *TUI*, *UPC*, *MSD*, *Volkswagen*, and *KwikFit*.

In my role as a Data Analyst at *Manchester City FC*, I implemented end-to-end data pipelines (ingress, ETL, data cubes) for use in reporting dashboards. My strengths in this role were more technical than analytical – which leads me now to pursue a career in programming.

Education

- **Master of Science in Data Science and Analytics** — with Distinction
  Department of Computer Science, Royal Holloway, University of London — *Sept. 2016 – Dec. 2017*
- **Bachelor of Engineering in Mechanical Engineering** — Upper Second Class with Honours
  School of Engineering, King's College London, University of London — *Sept. 2007 – July 2010*

Java Projects

- **Implementation of Value at Risk (VaR) measures in Java** (https://adrian.ng/java/var/) (https://github.com/Adrian-Ng/VaR)
  This dissertation project implemented various approaches to estimating *VaR*, a measure of risk. These are: *Model Building*, *Historical Simulation*, and *Monte Carlo Simulation*. In addition, the following approaches to estimating market variance/volatility were implemented: *Equal Weighted*, *Exponentially Weighted Moving Average*, and *GARCH(1,1)*.
  - **Object Oriented Design**
    As we have a number of approaches to estimating both *VaR*, *variance* and *volatility*, object oriented techniques and patterns were implemented.
  - **Concurrency**
    The *Monte Carlo* approach generates a large number of random walks, which can take a long time to fully execute in series. I used Java's concurrency API's to write a highly efficient solution.
  - **Data Ingress**
    Real-world market data was sourced using the *Yahoo Finance API*. These daily closing prices were transformed into daily price changes.
    Other inputs included the parameters of our hypothetical investment portfolio (market assets, deltas).
- **Option Pricing** (https://adrian.ng/java/options/) (https://github.com/Adrian-Ng/OptionPricer)
  This project implements three approaches to estimating option prices in Java: *Monte Carlo simulation*, *Black-Scholes equations*, and *Binomial Trees*.
  Apache Commons Math API was used to deal with some probabilistic assumptions.
- **Data Mining with Hadoop MapReduce** (https://github.com/Adrian-Ng/HadoopEnron)
  A number of *MapReduce* applications were written in Java with a variety of purposes including extracting the communications network from the *Enron Corpus*, a large dataset of emails, or aggregation of Twitter data.
  Applications were exported and executed on *Hadoop* clusters (both single node and distributed). Input/Output datasets were stored in HDFS and accessed via `hadoop fs` commands.
  A subsequent exercise was undertaken to minimise the verbosity of these *Hadoop MapReduce* applications by translating them to *Scala* for use in a *Spark REPL*.
- **Java 8 Streams with financial data** (https://adrian.ng/java/yahoofinance/#stream)
  A small exercise involving the use of *Java 8 Streams*. Processing real-world financial data to return *mean* and *equal-weighted variance* of some market asset.
- **Google PageRank**
  This is the implementation of Google's *PageRank* algorithm. I simulate the behaviour of someone browsing a series of webpages by computing a transition matrix from an input graph and mixing a Markov Chain.

Professional Experience

- **Manchester City Football Club** — Euston, London
  Data Analyst – Fan Relationship Management — *Jan. - July 2018*
  - **New York City FC Project**
    I took ownership of this project to integrate *NYCFC's* transactional and demographic data with *City Football Group's* data warehouse. This six-month project involved many phases including: data-discovery, architecture, and data processing. Data came from multiple external sources each with unique schema: (*NYCFC*, *Ticketmaster Salesforce*, *Major League Soccer*).
    - **Data Pipeline**
      I implemented a data pipeline to ingress data from a number of distributed *SQL* databases. This process was encapsulated in *stored procedures* which used appropriate DML & DDL (`OPENQUERY`, `MERGE`) for efficient ETL. This pipeline replaced the slower and more complex *Informatica* solution.
    - **Data QA**
      For QA I built an aggregated view to compare the distribution of `NULL` values. To store these analyses, I made use of *Data Cubes* which minimised bandwidth use across *CFG's* distributed databases and improved user experience when explorng these datasets in a *Tableau* front-end as all necessary computations had been performed up-stream.
    - **Mentoring**
      As part of this project, I was dedicated to mentoring a junior colleague remotely in New York. I organised weekly workshops to teach basic DML and more advanced DDL involving process encapsulation and automation. Additional material on my website helped supplement these workshops.
  - **GDPR Overhaul**
    This project involved the refactoring and streamlining of several critical existing production processes to merge GDPR preference data with the analytical database. To accomplish this, SQL DML such as `merge` was utilized. I worked closely with the development team to test and produce an automated process to merge these new customer preferences seamlessly into the existing database.
  - **Customer Lifetime Value**
    Implementation of a discrete-time periodic sales model (blah blah) Churn, SQL data mining. Modeling of LCV via *beta-gaussian, beta-binomial* model. Worked closely with data analysts to ensure optimal feature selection.

- **ITG Creator (Digital Marketing Agency)** — Westminster, London
  Senior CRM Campaign Executive – SQL Development — *Dec. 2013 - Sept. 2016*
  - **Virgin Media Segmentation Process**
    Built an end-to-end segmentation process (data ingress + config file = segmentation data). Close coordination with account executives Innovative use of `XML` + dynamic SQL + `OPENQUERY` resulted in efficient data fetching from remote server.
  - **Volkswagen New Client Onboarding**
    Work assessment group Testing Mobile and Email CRM Efficient approach using recursive query for regex
  - **TUI Content Redesign**
    Three-month project. Close liasing with client. Integration of new HTML from client into existing system. Ensuring design is reactive. Integrating *SQL* table with *HTML* content dynamically using robust `TCL` scripts to handle multiple design configurations.
    Efforts on this project were recognised by client.
  - **Soft Skills**
    - Attended inter-departmental work assessment groups and advised on work specifications.
    - As senior team member, served as point of contact for clients and colleagues looking to resource our team.
    - On occasion I held responsibility for resourcing and managing the team's workload using *Jira*.

- **Seatwave (now Ticketmaster)** — Moorgate, London
  Marketing Analyst Intern – Commercial Team — *May 2013 - Dec. 2013*
  - **Basic SQL**
    In this position I gained my first experience writing database queries in *SQL Server Management Studio*. With basic understanding of *DML* and *DDL*, I was able to query the ticketing and customer databases to extract data for warehousing, analysis, and CRM segmentation.

Technologies

- **Languages:** Java 8, T-SQL
- **Software:** IntelliJ IDEA, SQL Server Management Studio, Git, Jira, Maven
