# Adrian Ng MSc.

Seeking Junior-Level Data Engineering Opportunities

## Profile

I am a Computer Science graduate passionate about Data Engineering. I seek opportunities that further my growing experience in Java – which I have used in numerous academic projects ranging from the implementation of financial models to large-scale data processing with Apache Hadoop MapReduce.

Prior to postgraduate study, my expertise was in SQL development focusing on the implementation of CRM segmentation processes for a number of clients including: Virgin Media, TUI, UPC, MSD, Volkswagen, KwikFit. In my role as a Data Analyst at Manchester City FC, I implemented end-to-end data pipelines (ingress, ETL, data cubes) for use in reporting dashboards. My accomplishments in this role were actually more technical than analytical – which leads me now to pursue a career in programming.

## EDUCATION

# Master of Science in Data Science and Analytics

Department of Computer Science, Royal Holloway, University of London

with Distinction

Sept. 2016 - Dec. 2017

Email: contact@adrian.ng

Website: adrian.ng

# Bachelor of Engineering in Mechanical Engineering

School of Engineering, King's College London, University of London

Upper Second Class with Honours

Sept. 2007 - July 2010

## Java Projects

• Implementation of Value at Risk (VaR) measures in Java (https://adrian.ng/java/var/) (https://github.com/Adrian-Ng/VaR)

This dissertation project implemented various approaches to estimating VaR, a measure of risk: Model Building, Historical Simulation, and Monte Carlo Simulation. Approaches for variance/volatility estimates were also implemented: Equal Weighted, Exponentially Weighted Moving Average, and GARCH(1,1).

- o Object Oriented Design: As we have a number of approaches to estimating both VaR, variance and volatility, object oriented techniques and patterns were implemented.
- o Concurrency: The Monte Carlo approach generates a large number of random walks, which can take a long time to fully execute in series. I used Java's concurrency API's to write a highly efficient solution.
- o Data Ingress: To test a hypothetical investment portfolio (stocks, options, deltas), real-world market data was sourced using the Yahoo Finance API. A distribution of historical daily price changes was computed and used to estimate model parameters.

#### • Option Pricing

(https://adrian.ng/java/options/) (https://github.com/Adrian-Ng/OptionPricer)

This project implements three approaches to estimating option prices in Java: Monte Carlo simulation, Black-Scholes equations, and Binomial Trees. Apache Commons Math API was used to deal with some probabilistic assumptions.

## • Data Mining with Hadoop MapReduce

(https://github.com/Adrian-Ng/HadoopEnron)

A number of MapReduce applications were written in Java with a variety of purposes including extracting the communications network from the Enron Corpus, a large dataset of emails, or aggregation of Twitter data. Applications were exported and executed on *Hadoop* clusters (both single node and distributed). Input/Output datasets were stored in HDFS and accessed via hadoop fs commands.

A subsequent exercise was undertaken to minimise the verbosity of these Hadoop MapReduce applications by translating them to Scala for use in a Spark REPL.

## Java 8 Streams with financial data

 $({\rm https://adrian.ng/java/yahoofinance/\#stream})$ 

A small exercise involving the use of Java 8 Streams. Processing real-world financial data to return mean and equal-weighted variance of some market asset.

## Professional Experience

# Manchester City Football Club

Euston, London

Jan. - July 2018

New York City FC Project

Data Analyst - Fan Relationship Management

I took ownership of this project to integrate NYCFC's transactional and demographic data with City Football Group's data-warehouse. This six-month project involved many phases including: discovery, engineering, and analysis. Data came from multiple external sources each with differing schema: NYCFC, Ticketmaster Salesforce, Major League Soccer.

# \* Data Pipeline

I implemented a data pipeline to ingress data from a number of remote SQL databases. This process was encapsulated in stored procedures which used appropriate DML & DDL (OPENQUERY, MERGE) for efficient ETL. This pipeline replaced the slower front-end *Informatica* solution.

#### \* Data Cubes

I used an aggregated dataset to compare the distribution of NULL values. These analyses were transformed to Data Cubes to pre-compute every possible roll-up/drill-down. As such, bandwidth was minimised across our distributed servers and need for real-time computation in Tableau front-end was eliminated, resulting in improved user-experience.

#### \* Mentoring

As part of this project, I was dedicated to mentoring a junior colleague remotely in New York. I organised weekly workshops to teach basic DML and more advanced DDL with a goal toward self-sufficiency in writing database queries and working with stored procedures. Additional material on my website helped supplement these workshops.

# • GDPR Preferences Integration

I worked on the integration of a GDPR preference stream into our SQL and Salesforce databases. This required the creation of a new pipeline and the refactoring of numerous processes downstream.

Working with the development team, I provided specification and UAT testing. Using primary key constraints, clustered indexes, triggers and MERGE, I was able to build an efficient, automated process with relational schema.

#### Customer Churn Model

I contributed datasets and collaborated on feature/model selection. In particular, looking at logistic regression and Beta-Geometric/Beta-Bernoulli models in R Studio.

# ITG Creator (Digital Marketing Agency)

Westminster, London

Dec. 2013 - Sept. 2016

Senior CRM Campaign Executive - SQL Development The majority of my work in this role involved working with SQL processes which were used to transform customer data into CRM segmentations. As senior team member, I developed a number of these processes. On

occasion, I held responsibility for resourcing and managing the team's workload using Jira.

# o Virgin Media Segmentation Process

(https://adrian.ng/SQL/cte/Recursion/ (https://adrian.ng/SQL/misc/openquery-xml)

I built an end-to-end segmentation process in SQL. This included building a fast, flexible, and bespoke import tool around BULK INSERT. Remote server queries (OPENQUERY) made use of XML to effectively INNER JOIN local and remote tables resulting in speed and minimial resource use on a busy live server. Recursive queries were used to implement a solution (similar to flatMap in Java 8) for efficient regex.

#### Volkswagen Client Onboarding

I worked with .NET developers and project managers to bring Volkswagen on-board as a new client. This required implementing a new segmentation process for broadcasting email and SMS. In addition, I provided specification to developers for their data warehousing/archiving ingress schema.

## o TUI Mailing Redesign

I collaborated closely with the TUI client during a three-month project to redesign the existing Thomson and First Choice mailings. TCL scripting was used to merge dynamic content into the HTML body. My efforts on this project were recognised by the client.

# Seatwave (now Ticketmaster)

Moorgate, London

Marketing Analyst Intern - Commercial Team

May 2013 - Dec. 2013

• In this position I gained my first experience writing database queries in SQL Server Management Studio. With basic understanding of DML and DDL, I was able to query the transactional/customer databases to return data for warehousing, reporting, and segmentation.

## TECHNOLOGIES

• Languages:

• Software: IntelliJ IDEA, SQL Server Management Studio, Git, Jira, Maven
