Summary

Computer Science graduate seeking junior-level Data Engineering roles. In particular: opportunities that apply and grow my Java skill-set, which has been utilised throughout my postgraduate studies and in solo projects since then. Prior to postgraduate study, my technical expertise was in SQL development. My recent role as a Data Analyst was a brief but beneficial learning experience: I flourish when writing code and solving technical problems of that nature. Thus naturally follows a career in programming.

EDUCATION

Master of Science in Data Science and Analytics

Department of Computer Science, Royal Holloway, University of London

with Distinction Sept. 2016 – Dec. 2017

Bachelor of Engineering in Mechanical Engineering

School of Engineering, King's College London, University of London

Upper Second Class with Honours

Sept. 2007 – July 2010

Java Projects

• Dissertation: Implementation of Value at Risk (VaR) measures in Java

 $(https://adrian.ng/java/var/) \qquad (https://github.com/Adrian-Ng/VaR)$

This project implements various approaches to estimating VaR, a measure of risk. These are: Model Building, Historical Simulation, and Monte Carlo Simulation. In addition, the following approaches to estimating market variance- are implemented: Equal Weighted, Exponentially Weighted Moving Average, and GARCH(1,1).

Object Oriented Design

As we have a number of approaches to estimating both VaR and variance, abstract methods getVariance() and getVaR() are defined in abstract classes but implemented in child classes. Instantiation of these child classes is handled via the $factory\ method$.

Concurrency

The Monte Carlo approach generates a large number of random walks, which can take a long time to fully execute. Therefore execution is parallelized using java.util.concurrent for which Callable and Future lambdas are implemented.

o Data Ingress

Real-world market data is sourced using the Yahoo Finance API, which returns an iterable collection of BigDecimal. These daily closing prices are transformed into daily price changes of type Double[]. Thus sacrificing accuracy for computational performance.

The hypothetical portfolio with a number of stocks and options was defined locally across a number of text-files.

• OptionPricer

 $({\tt https://adrian.ng/java/options/}) \qquad ({\tt https://github.com/Adrian-Ng/OptionPricer})$

This project implements three approaches to estimating option prices in Java: Monte Carlo simulation, Black-Scholes equations, and Binomial Trees. Option prices for each of these approaches were retrieved through the interface methods getCall() and getPut(). Abstract classes were also used to facilitate the implementation of various real-world option types, which each differ in how pay-off is calculated.

A number of MapReduce applications were written in Java with a variety of purposes: e.g. extracting the communications network from the $Enron\ Corpus$ or aggregation of Twitter data in JSON format. These applications extended Mapper and Reduce. Methods map() and reduce() were overridden with bespoke implementation.

A subsequent exercise was undertaken to minimise the verbosity of these $Hadoop\ MapReduce$ applications by translating them to Scala for use in a $Spark\ REPL$.

• Mini Project: Java 8 Streams with financial data

(https://adrian.ng/java/yahoofinance/#stream)

A small exercise involving the use of Java 8 Streams. Processing real-world financial data to return mean and variance by defining input functions to map() and reduce() methods.

Postgraduate Coursework: Implementation of Machine Learning Algorithms

• R Language:

k-Nearest Neighbours LDA/QDA Kernel Methods

Neural Network regression Decision Trees Hierarchical Clustering

• MATLAB:

Hidden Markov Models Aggregating Algorithm

Professional Experience

Manchester City Football Club

London

Jan. - July 2018

Data Analyst

o NYCFC Project

This SQL data engineering project involved the implementation of processes to automate the ingress of external data sources (transactional data from Ticketmaster, customer data from NYCFC). Conferencing with stakeholders (New York City FC) and partners (Major League Soccer) was necessary to understand the *data situation*.

o GDPR Customer Preferences

This project involved the creation of a number of automated processes to merge GDPR preference data with the analytical database. To accomplish this, SQL DML such as *merge* were utilised.

o Tableau Dashboard Automation/Optimisation

Implemented *Data Cubes* to pre-aggregate data along all possible subset of categorical fields. That is, every possible drill-down and roll-up was computed in advance. As a result, front-end dashboards retained their exploratory flexibility but removed real-time computational burden. Thus improving user-experience.

• Guiding and Mentoring

Instructing junior colleagues on SQL Server Management Studio best practices and fundamentals. E.g. understanding DDL & DML for writing SQL queries and creating database objects; when to return a *product join* vs *semi-join*; making use of *information_schema*; utilising *SQL Agent* to schedule jobs. Both regular and ad-hoc workshop sessions were held in order to provide this instruction.

ITG Creator Westminster

Senior CRM Campaign Executive

Dec. 2013 - Sept. 2016

o Virgin Media Processes

Built an automated segmentation process using SQL stored procedures for other members of the team to utilise. Recipient data were imported via *BULK INSERT*, stored in database tables and indexed (clustered). Segmentation data was output and linked to HTML content to be broadcast to recipients.

o Recursion

 $\rm https://adrian.ng/SQL/cte/Recursion/$

Used recursive queries (CTEs) to clean data e.g. removing *n*-number of leading zeros from mobile phone numbers in order to prefix with dialling codes; or splitting strings and mapping into relational format.

Query Execution

 $({\rm https://adrian.ng/SQL/misc/openquery-xml})$

Improved cross-server query execution speeds by using *OPENQUERY*, which transmits a SQL query in string format to the remote server. Dynamic SQL was utilised to include XML data in the string. Using a *CTE*, this XML could be represented as relational object. Effectively this allowed us to join and filter on the remote server using data from the local sever. As a result, only a small data set was returned via the *OPENQUERY*.

o Soft Skills

Attended inter-departmental work assessment groups and advised on job specifications. As senior team member, served as point of contact for clients and colleagues looking to resource our team. Jira was used to monitor workload and queue work to team members.

• Languages: Java 8, T-SQL

• Software: IntelliJ IDEA, SQL Server Management Studio, Sublime, Git, Jira, Maven
